Class 8 Science: Force and Pressure Illustrated Notes

VTU Community Project • VidyaSetu Digital Library
Class 8 (■■■ ■■■■■) • Science • Prepared by: Govt School Science Teacher Forum

1. What is Force?

A push or a pull on an object is called a force. Forces arise due to an interaction between objects. Force has both magnitude and direction. The SI unit of force is the Newton (N).

2. Effects of Force

Force can:
• Change the state of motion of an object.
• Change the speed of a moving object.
• Change the direction of motion.
• Change the shape and size of an object (e.g. stretching a spring or pressing clay).

3. Pressure in Everyday Life

Pressure is force acting per unit area: **Pressure = Force / Area**. This explains why sharp knives cut vegetables more easily than blunt knives (smaller contact area produces greater pressure), and why heavy school bags have broad shoulder straps (larger area reduces pressure on shoulders).
